- 1. A method of controlling an arrangement of a plurality of hardware components, at least some of which are coupled to one another via signal leads, by means of a data processing unit and a computer program which is executed therein, characterized in that the computer program comprises sub-modules (2', 3') which correspond to the hardware components (2, 3) and are connected via data channels in conformity with the real signal leads between the hardware components (2, 3).
- 2. A method as claimed in claim 1, characterized in that the sub-modules (2', 3') of the computer program and/or the data channels between the sub-modules are adapted in conformity with the dynamic changing of the hardware components and/or the signal leads between the hardware components.
- A method as claimed in claim 1, characterized in that all data channels utilize
 the same communication protocol.
- A method as claimed in claim 1, characterized in that the hardware components are printed circuit boards, layout cells, microchips and/or core cells.
- 5. A data and signal processing device which includes a plurality of hardware components, at least some of which are coupled to one another via signal leads, and also a data processing unit which serves to control the hardware components (2, 3) and in which a computer program can be executed, characterized in that the computer program comprises sub-modules (2', 3') which correspond to the hardware components (2, 3) and are connected via data channels in conformity with the real signal leads between the hardware components (2, 3).
 - A data and signal processing device as claimed in claim 5, characterized in
 that it is a television set, a video recorder, a set top box or an audio apparatus.
